

YOGESH SANJAY GHOGARE

AUTOMATION TEST ENGINEER

PHONE | (+91) 8329222473
EMAIL | ghogareyogesh2015@gmail.com
LOCATION | Pune, INDIA
EXPERIENCE | 6 Years 10 Months

Key Skills

- Playwright Automation
- Pytest Framework
- Robot Framework (Currently Learning)
- Python Scripting
- Appium (Android/iOS)
- Retrieval Augmented Generation
- Agentic AI
- Cursor / Github Copilot
- Jenkins / GitLab CI
- Docker
- OpenAI / Anthropic Claude

Certification

- Mastering Generative AI: Agents With RAG And LangChain

Languages

- English
- Marathi
- Hindi

Education

B.Tech / B.E. — Information Technology
2019
MGM Jawaharlal Nehru Engineering College

Profile Summary

QA Automation Engineer with 6+ years of expertise in building scalable test automation frameworks using Python, Playwright, Appium, and Pytest for web, mobile, and API testing. Experienced in testing RAG/LLM-based AI applications for response accuracy, context relevance, and hallucination detection. Skilled in developing AI-powered testing tools using FastAPI, Anthropic Claude, and OpenAI, with hands-on experience in cloud device farms (LambdaTest, BrowserStack), CI/CD pipelines, Docker, and Allure reporting with historical trend analysis.

Work Experience

Automation Test Engineer

Amdocs Development Centre India LLP — Transport for London (TfL)
July 2019 – June 2023 (4 Years)

XML Data Processing & Automated Reporting — Transport for London

- Developed robust Python automation scripts to parse, process, and transform complex XML files carrying Penalty Charge Notice (PCN) data for vehicles driving through London, generating correctly structured output files to sustain accurate downstream data flow across TfL environments.
- Engineered a Python-based Daily Sanity Reporting Service using Pandas and DataFrames, producing fully automated, styled HTML email reports dispatched automatically to all project stakeholders upon completion of each daily sanity execution cycle.
- Designed and implemented a Python-based Data Analytics Mailing System to proactively monitor end-to-end data flow across multiple environments, providing real-time visibility into pipeline health and alerting stakeholders to data anomalies or processing failures.

Technologies: Python, Pandas, XML Processing, HTML Email Automation, SMTP, DataFrames

Automation Test Engineer

Amdocs Development Centre India LLP — Etisalat
July 2023 – October 2025 (~2 Years 3 Months)

CI/CD, Web & Mobile Automation — Etisalat

- Architected and implemented end-to-end CI/CD pipelines on Jenkins enabling one-click execution of full test suites, integrated with Grafana dashboards for real-time monitoring of test execution metrics and visualisation of historical trend reports.
- Built a Python-based utility to aggregate and generate Cumulative Regression Execution Reports, consolidating results from multiple test suites into a single unified report for stakeholder review and release sign-off decisions.
- Led a team of 4 QA Engineers in Web Automation, designing and delivering a scalable Playwright + Python framework for automated testing of web applications and REST APIs, establishing team coding standards, Page Object Model patterns, and peer-review practices.
- Architected and delivered a comprehensive Mobile App Automation Framework using Pytest + Appium, enabling reliable cross-device test coverage across Android and iOS platforms with parallel execution support via pytest-xdist.

Technologies: Python, Playwright, Pytest, Appium, Jenkins, Grafana, REST APIs, Docker, pytest-xdist

Software Developer — AI Vibe Coding / Agentic Automation

Amdocs Development Centre India LLP — Mobile Device Automation Agent

October 2025 – May 2026 (~7 Months)

AI-Powered Multi-Agent Mobile QA Platform (mobileqa-agent)

- Architected and developed mobileqa-agent — a production-grade multi-skill Agent-to-Agent (A2A) JSON-RPC automation platform built on Python and Starlette, exposing five core agent skills: Orchestrator, Planner, Generator, Executor, and Self-Healer for fully autonomous mobile app test lifecycle management.
- Integrated a pgvector-backed RAG (Retrieval-Augmented Generation) pipeline for intelligent test case retrieval, semantic deduplication, and context caching — significantly reducing LLM token consumption and improving execution latency.
- Enforced a Crawl-First Architecture with live BFS DOM crawling, typed DOMSnapshot and CrawlPlanEntry dataclasses, and per-page vector store writes, enabling accurate LLM-guided navigation planning decisions.
- Extended the platform to support multi-framework test generation and execution across six frameworks: Python-Pytest-Appium, Java-TestNG-Appium, JavaScript-WDIO, Swift-XCUI Test, Kotlin-Espresso, and Roku-BrightScript via a unified RUNNER_REGISTRY and TestOutcome report builder.
- Leveraged OpenAI and Anthropic Claude APIs with vision-based coordinate tapping, perceptual hashing for stable-screen detection, and adaptive loop-guard mechanisms — eliminating crawler loop defects and DOM locator failures.

Technologies: Python, Starlette, A2A JSON-RPC, Appium, pgvector, OpenAI, Anthropic Claude, FastAPI, Docker, Allure, LambdaTest
